

Icha and Three Mythic Burbs

A grand plan for three Mythic Sagi birds | Bombast in the prose | Average odds in the numbers

NOT ONE. NOT TWO. THREE.

Icha has a tremendous plan. An absolutely tremendous plan. The kind of plan that makes the whole hutch stop pecking and pay attention. Icha is going to build a flock with **three Mythic burbs**. Three magnificent, outrageously prestigious, top-of-the-rarity-ladder burbs.

One Mythic burb would be impressive. Two would be a statement. But Icha has selected three, because this operation is thinking big. Very big. The ambition has feathers. The feathers have standards. And the standards are Mythic.

The ordinary burbs will arrive. The traps will do their work. The food will be stocked. The water will be ready. Then Icha will move the operation upward: Common to Uncommon, Uncommon to Rare, Rare to Epic, Epic to Legendary, and Legendary to Mythic. A beautiful ladder. Every rung accounted for.

This is a grand pink undertaking with hearts in the margins and serious arithmetic underneath. Icha brings the vision. The breeding chain brings the odds. The final goal is unmistakable: **three Mythic burbs, sitting there like they own the place.**

♥ a tremendous little flock, uwu ♥

A Tremendous Amount of Burb

Expected consumption for three Mythics | Reused failed results | No bad luck percentile budget

♥ The average size of the operation

What Icha is planning	Average quantity
Mythic Sagi birds at the finish	3
Starting Common domesticated birds	974.56
Breeding attempts across all rarity steps	971.56
Combined timer hours	1,364.38

Approximately **975 Common burbs**. A tremendous starting flock. That figure is a rounded average planning amount, not a guarantee that 975 will produce three Mythics. Icha is planning around expected results; actual luck can move the total in either direction.

♥ The hours have feathers too

Stage	Average timer hours
Trapping the starting birds	464.07
Domesticating those birds	414.52
Breeding toward three Mythics	485.78
TOTAL	1,364.38

The total is about **56 days and 20 hours** if every timer runs sequentially. These are accumulated timer hours, not a promise of calendar completion time. Parallel traps, domestication spaces, and breeding slots can overlap their work.

How Icha Builds the Flock

Capture | Care | Breed | Repeat until three Mythics occupy the hutch

♥ First the traps then the transformation

+ The trapping operation

Each baited trap checks after 9 to 11 minutes, averaging 10. A check has a 35% capture chance, a 5% chance of needing fresh bait, and a 60% chance of continuing. With immediate rebaiting, Icha budgets 28.57 timer minutes per captured bird.

The domestication operation

A captured bird first waits 9 to 11 minutes for a care need. After tending, a 10 to 15 second growth check has a 40% chance of domestication. Otherwise the cycle repeats. Icha budgets 25.52 timer minutes per Common domesticated bird.

♥ The five beautiful rarity steps

Breeding step	Upgrade chance
Common to Uncommon	50%
Uncommon to Rare	48%
Rare to Epic	46%
Epic to Legendary	44%
Legendary to Mythic	42%

Each 30-minute attempt consumes two same-rarity birds, three Sagi Bird Food, and one Water Bucket. It returns one bird. Icha reuses a same-rarity result after a failed upgrade and replenishes its partner. The birds are consumed; the same pair cannot be bred again.

The final picture

Three Mythic burbs. An absurdly distinguished little flock. Icha's plan has the spectacle, the sequence, and the numbers. Tremendous feathers. Tremendous ambition. A very pink path to the top.
